

Gui is a graphical interface made for general ease of use, for example if you were to create a shortcut using a secondary platform such as steam, it would pop up on your desktop for personal use. In comparison, if you wanted to do the same thing without the assistance of any Gui or external platforms, Cli is able to do the same thing by using text lines to command your computer to do the same or similar thing with your command prompt reader built into your windows device. Gui is essentially ease of use, while Cli is actual command prompts instead of graphics on screen explaining or using placeholders to represent specific actions.
